

## CAN transceiver for 24 V systems

The HT82C251A is the interface between the CAN protocol controller and the physical bus.. The device provides differential transmit capability to the bus and differential receive capability to the CAN controller. The IC is intended for automotive electronic applications

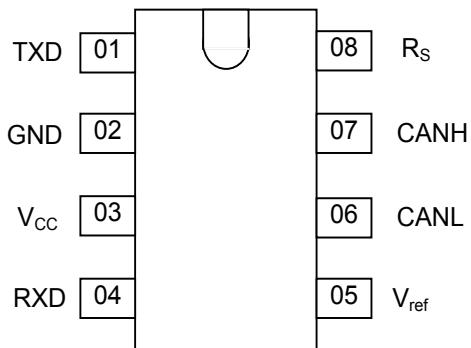

### Main features

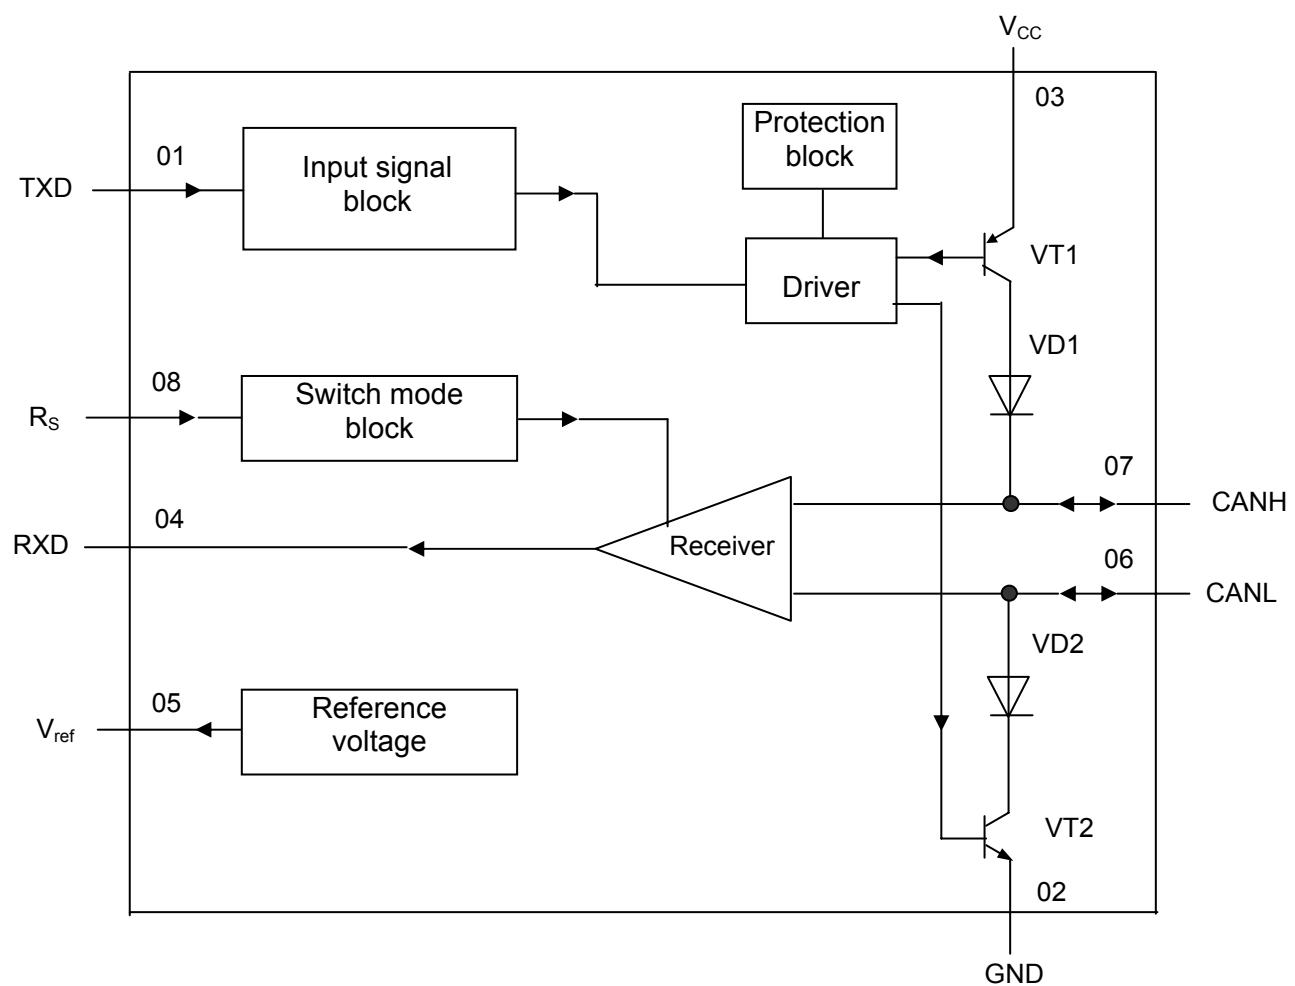

- Fully compatible with the “ISO 11898-24 V” standard
- Thermally protected
- Short-circuit proof
- Three mode operation
- High speed of data transfer (up to 1 Mbit/s)
- High immunity against electromagnetic interference.
- Permissible value of electrostatic potential is 2000V.

T<sub>A</sub> = -40° to 150°C for all packages.

## FUNCTIONAL DESCRIPTION

The HT82C251A provides differential transmit capability to the bus and differential receive capability to the CAN controller. Data transfer rate is up to 1 Mbit/s.

Output stage has good load capacity. It guarantees 2V peak-to-peak output voltage for  $60\Omega$  load. HT82C251A has thermal and short circuit protection, high immunity to EMI and is fully compatible with the "ISO 11898-24 V" standard.

The IC provides three operation modes: high-speed, reduced RFI mode, standby mode. The design of HT82C251A permits possibility of adjustment of rise and fall slope of output stages (transistors).

Pin  $R_S$  is used to select one of three modes of operation: high-speed, reduced RFI or standby. High level applied to this pin switches the IC to standby mode, low level – to high-speed mode. The high-speed mode is selected by connecting pin  $R_S$  to ground. To reduce RFI, connect pin  $R_S$  by resistor  $R_{\text{ext}}$  to ground. The rise and fall slope of output stages (transistors) can be regulated with  $R_{\text{ext}}$  resistance.

To select high-speed dominant mode a low level voltage ( $\sim 1 \text{ V}$ ) is applied to TXD pin and  $R_S$  is connected to ground, CANH and CANL pins are connected by  $60\Omega$  resistor.

Guaranteed peak-to-peak output voltage (high and low level) will be 1,5 V for all operating supply voltage range

To select recessive mode a high level voltage ( $\sim 4 \text{ V}$ ) is applied to TXD pin and  $R_S$  is connected to ground. In recessive mode bus output voltage  $V_{6,7}$  is about ( $\sim 2.5 \text{ V}$ ).

High level ( $\sim 4\text{V}$ ) applied to pin  $R_S$  switches IC to standby mode (with low power consumption); in this mode consumption current doesn't exceed  $270 \mu\text{A}$ . In this mode transmitter is turn off and consumption current of receiver and all circuit is significantly decreased.

Reference voltage value  $V_{\text{REF}}$  per 05 output is half of supply voltage.

**Table 6 - Truth table of the transceiver**

Supply voltage range, $V_{CC}$ , V	TXD pin	CANH pin	CANL pin	Bus state	RXD output
4,5 ÷ 5,5	L	H	L	Dominant	L
4,5 ÷ 5,5	H	Floating	Floating	Recessive	H *
4,5 ÷ 5,5	X	Floating, if $V_{RS} > 0,75 V_{CC}$	Floating, if $V_{RS} > 0,75 V_{CC}$	Floating	H *
0 ÷ 5,5	Floating	Floating	Floating	Floating	X

Notes

1 H – high level voltage; L – low level voltage; X – 6 don't care (H or L).

2 Floating state – half of sum of output levels on pins 06 and 07 ( $V_{O(CANL)} + V_{O(CANH)} / 2$ ).
