

## Description

The SL9013 Series are highly precise, low noise, positive voltage LDO regulators manufactured using CMOS processes. The SL9013 performance is optimized for battery-powered systems to deliver ultra low noise and low quiescent current. Regulator ground current increases only slightly in dropout, further prolonging the battery life. The SL9013 Series also works with low-ESR ceramic capacitors, reducing the amount of board space necessary for power applications, critical in hand-held wireless devices. The SL9013 Series consumes less than 1µA in shutdown mode and has fast turn-on time less than 50s. The other features include ultra low dropout voltage, high output accuracy, current limiting protection, and high ripple rejection ratio.

## Features

- Ultra Low Noise for RF Application
- Ultra Fast Response in Line/Load Transient
- Low Power Consumption: 70µA(Typ.)
- PSRR=75dB@1KHz
- Maximum Output Current: 500mA
- Low Dropout : 100mV @ 100mA at  $V_{OUT}=3.3V$
- Operating Voltage Ranges : 2V to 6.5V
- Over Temperature and Current Limiting Protection
- Thermal Shutdown Protection

## Applications

- Battery-Powered Equipment
- CDMA/GSM Cellular Handsets
- Audio/Video Equipment

**Note 1.** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

- ESD testing is performed according to the respective JEDEC standard. The human body model is a 100pF capacitor discharged through a 1.5KΩ resistor into each pin. The machine model is a 200pF capacitor discharged into each pin.

## Applications Information

### Input Capacitor

A 1 $\mu$ F ceramic capacitor is recommended to connect between VIN and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both VIN and GND.

### Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended minimum output capacitance is 1 $\mu$ F, ceramic capacitor is recommended, and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot. Place output capacitor as close as possible to V<sub>OUT</sub> and GND pins.

### Enable Function

The SL9013 has an EN pin to turn on or turn off the regulator, When the EN pin is in logic high, the regulator will be turned on. The shutdown current is almost 0 $\mu$ A typical. The EN pin may be directly tied to V<sub>IN</sub> to keep the part on. The Enable input is CMOS logic and cannot be left floating.

### Thermal Considerations

For continuous operation, do not exceed absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated by the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / R_{\theta JA}$$

Where T<sub>J(MAX)</sub> is the maximum operation junction temperature 125 °C, T<sub>A</sub> is the ambient temperature and the R <sub>$\theta$ JA</sub> is the junction to ambient thermal resistance.

The power dissipation definition in device is:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_Q$$

### Layout Consideration

By placing input and output capacitors on the same side of the PCB as the LDO, and placing them as close as is practical to the package can achieve the best performance. The ground connections for input and output capacitors must be back to the SL9013 Series ground pin using as wide and as short of a copper trace as is practical. Connections using long trace lengths, narrow trace widths, and connections through via must be avoided. These add parasitic inductances and resistance that results in worse performance especially during transient conditions.
