XBLW MAX3485

15 Mbps communication transceiver

WEB | www.xinboleic.com

Description

MAX3485 is 3V to 5.5V power supply, $\pm 15\text{kV}$ anti-static slow limit differential transceiver and can provide complete RS485 compatibility for half-duplex applications. Each section contains a driver and a receiver designed for data transmission over an extended common-mode range (-7V to +12V). It can effectively transmit data at a high rate of up to 15Mbps.

The MAX3485 series also features enhanced ESD protection function. By using IEC61000-4-2 air gap discharge, the all-transmitter output and receiver input are protected to $\pm 15\text{kV}$. If adopting HBM, the protection can be $\pm 15\text{kV}$. If adopting the IEC61000-4-2 contact discharge protection, the protection can be $\pm 8\text{kV}$.

Drive short-circuit current is limited. When the driver output is placed in a high impedance state through a thermal shutdown circuit, the driver can prevent excessive power consumption. The receiver (R X) input has a "Fail safe" design that ensures a logically high Rx output when the RX input is floating, shorted, or terminated but not driven.

Both components have power-on/off modes, and fault-free driver outputs allow transceivers to be inserted or removed from bus in real time. CMOS designs aim to offer significant power savings without sacrificing overload or ESD damage. Typically, static current is only 300uA in operation and 1uA in shutdown mode.

Feature

- High communication rate, 3.0V ~ 5.5V power supply 15Mbps
- High ESD protection
- Low power consumption down to 1uA, shutdown mode
- Input voltage range: -7V~+12V (common mode)
- Bus connection up to 256 nodes
- Thermal shutdown protection function
- Drive overload protection function
- Full fault-safe (open circuit, short circuit, etc.)

Product Application

- Power communication
- Integrated digital network
- Industrial control local area network
- Power measurement (smart meter)
- Factory automation and control

Ordering Information

Note 1: The input pulse is supplied by a generator with the following characteristics: PRR = 250kHz, 50% duty cycle, $t_f \leq 6.0\text{ns}$, $Z_O = 50\Omega$.
Note 2: C_L includes probe and stray capacitance.

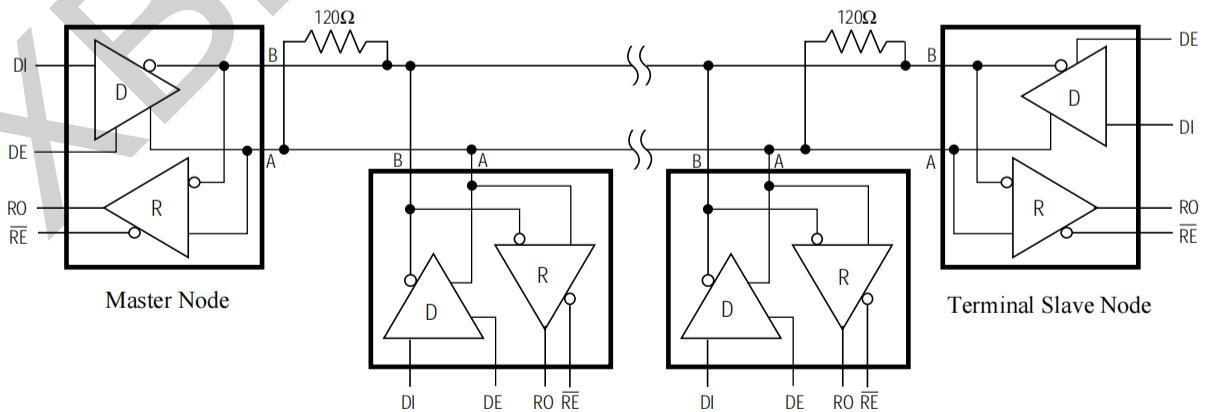

Figure 9 Typical Half-duplex RS-485 Network Application

Detailed Function Description

The MAX3485 series is a low-power transceiver for RS-485 communication network and can support data transmitting rates up to 15 Mbps. All components are half duplex, including the Drive Enable (DE) and ReceiverEnable (RE) pins. When powered off, the outputs of driver and receiver are high impedance.

◆ ESD Protection

The MAX3485 A B pins are particularly susceptible to ESD shocks because they are typically as external pins in products. Human actions like simply touching the pins or other actions can result in ESD problems.

Though MAX3485 itself already has good ESD capabilities, additional ESD protection devices are suggested to be added between the external A pin and B pin to enhance its performance.

◆ Low Power and Shutdown Mode

Low power shutdown mode is initiated by turning \overline{RE} up and turning DE down. When powered off, the device typically draws only 1uA of supply current. \overline{RE} and DE can be driven simultaneously. When \overline{RE} in high and DE are less than 50ns, the components are guaranteed to continue. If the input is in this state for at least 300ns, the components are guaranteed to close. From the switching characteristics table, if the Enable Times t_{PZH} and t_{PZL} is not in a low power shutdown state and the component to start the enable times is turned off, Time of enabling the driver and receiver from low power off mode (t_{PSH} , t_{PSL}) takes longer than that of enabling them from disabled mode (t_{PZH} , t_{PZL}).

◆ Bus Supports 256-node Transceiver

The standard RS-485 receiver has an input impedance of 12k Ω (one unit load), and the standard driver can drive up to 32 unit loads. The MAX3485 transceiver has a 1/8 unit load receiver with input impedance (96k Ω), allowing 256 transceivers to be connected in parallel on a single communication line. Any combination of these devices and/or other RS-485 transceivers with totaling 32 unit loads or less can be connected to the line.

◆ Output Protection

The output protection mechanism can prevent excessive output current and power loss due to faults or bus contention. First, the folded current limit on the output stage can provide immediate short-circuit protection over the entire common-mode voltage range. Second, a thermal shutdown circuit can force the driver output to a high impedance state if the mold temperature becomes too high.

Statement:

- XBLW reserves the right to modify the product manual without prior notice! Before placing an order, customers need to confirm whether the obtained information is the latest version and verify the completeness of the relevant information.
- Any semi-guide product is subject to failure or malfunction under specified conditions. It is the buyer's responsibility to comply with safety standards when using XBLW products for system design and whole machine manufacturing. And take the appropriate safety measures to avoid the potential in the risk of loss of personal injury or loss of property situation!
- XBLW products have not been licensed for life support, military, and aerospace applications, and therefore XBLW is not responsible for any consequences arising from the use of this product in these areas.
- If any or all XBLW products (including technical data, services) described or contained in this document are subject to any applicable local export control laws and regulations, they may not be exported without an export license from the relevant authorities in accordance with such laws.
- The specifications of any and all XBLW products described or contained in this document specify the performance, characteristics, and functionality of said products in their standalone state, but do not guarantee the performance, characteristics, and functionality of said products installed in Customer's products or equipment. In order to verify symptoms and conditions that cannot be evaluated in a standalone device, the Customer should ultimately evaluate and test the device installed in the Customer's product device.
- XBLW documentation is only allowed to be copied without any alteration of the content and with the relevant authorization. XBLW assumes no responsibility or liability for altered documents.
- XBLW is committed to becoming the preferred semiconductor brand for customers, and XBLW will strive to provide customers with better performance and better quality products.
