

GENERAL DESCRIPTION

The SGM7SZ04 is a single inverter with the advanced CMOS technology. The supply voltage pin of this device accepts any voltage from 1.65V to 5.5V. The input can tolerate the maximum of 6V, regardless of the supply voltage range. When V_{CC} is 0V, the input and output are in the high-impedance state.

This device can achieve ultra-high speed operation with high output drive, meanwhile, the low static power dissipation is maintained over the wide supply voltage operating range.

The SGM7SZ04 is available in Green UTDFN-1.45×1-6L, SC70-5 and SOT-23-5 packages. It operates over an ambient temperature range of -40°C to +125°C.

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

NOTES:

- Unused input must be held high or low. It may not float.
- C_{PD} is defined as the value of the internal equivalent capacitance which is derived from dynamic operating current consumption (I_{CCD}) at no output loading and operating at 50% duty cycle (see Figure 3). C_{PD} is related to dynamic operating current I_{CCD} by the expression: I_{CCD} = (C_{PD}) (V_{CC}) (f_{IN}) + (I_{CC,Static}).
